                                                                                                                                                                                                   The present nucleotide sequence is that of an open reading frame encoding CLO chloroplast-targeted chorismate pyruvate lyase (CPL) fusion protein TP-CLD candot chorismate pyruvate lyase (CPL) fusion protein TP-CLD (SPE GREE ABASOSS). PCR (see ABASOSS). PCR (see ABASOSS). PCR (see ABASOSS) are deed to generate a DNA fragment corresponding to the transit peptide of tomato Rubisco small cubunit and the first 4 amino acid residues of mature Rubisco. The DNA fragment was ligated into pET44-CPL). Which carries the Bacherichia coli CPL open reading frame (see ABASOSS). The TP-CPL construct is an example of expression cassettes of the invention that are designed for the high-CC everyone of TP-CPL in the chloroplast releases a novel polypeptide (see AMSOSS) that has full enzyme activity, converting chorismate to pHBA. A claimed plant comprising a CPL expression cassette is selected from soybean, rapessed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, millet, bean, pea, rye, flax or a forage grass. PHBA is a monomeric component of liquid crystal polymers which have application in the automative, electrical and other industries. (Updated on 29-AUG-2003 to catendardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose accumulator 1) encoding sinapoylglucose.malate sinapoyltransferase (SNT). SNT catalyses the substitution of a glucose moiety on a glycosylated aromatic acid with a malate moiety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acid. The enzyme is conjugated aromatic acids or aromatic esters. The malate conjugated aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for TP-CPL (tomato Rubisco small subunit precursor for rbcs2-Bscherichia coli chorismate pyruvate lyase (CPL)) fusion protein is described in the

The invention relates to a novel isolated nucleic acid that encodes a UDP '-glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (p-hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LCPs) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food production of these compounds and for identifying similar enzymes by tomatc/Bscherichia coli chimeric TP-CPL (chorismate pyruvate lyase) DNA toward.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 AGCATGGTTGCACCTTTCACTGGTCTCAAATCTTCAGCCACTTTCCCTGTTACAAAGAAG 120

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method reliable upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid (p-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce contain. Plants and microbes can be genetically engineered to produce thigh levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-bydroxycinnamoy-Loch hydroxycinnamoy-Loch hydratases/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidan, antimicrobial agent, anti-continuamentory agent and inhibitor of carcinogenesis (melanoma). The present sequence is tomato rubisco small subunit precursor (rbc62) transit peptide (chloroplast transit peptide; TP)-Escherichia coli CPL chimeric DNA. This sequence is present in the B. coli expression vector construct pET24a-TP-CPL.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin, 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxypenzoic acid (p-hydroxybenzoic acid, pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial high levels of pHBA either by functional expression of the bacterial chort chorismate pyruvate lysse (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (CPL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, antimicrobial agent and inhibitor of carcinogenesis (melanoma). The inflammatory agent and inhibitor of carcinogenesis (melanoma). The Escherichia coli chorismate pyruvate lysse (CPL) and Arabidopsis thaliana UDP-glucosyltransferase (UGT72B1) chimeric DNA.

The present invention relates to methods and materials to produce hydroguinone glucoside (arbutin; 4-hydroxyphenyl-beta-b-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismete pyravet lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-hifammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Escherichia coli chorismate pyruvate lyase (CPL) DNA. This sequence is found in the E. coli expression vector construct
                                                                                    480

The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxypenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce arbutin. Plants and microbes (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis PHBA 1-hydroxylasm (PHB 1-H) and

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids acid (pHB) which comprises transforming microorganisms with plasmids carying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubiC gene encoding chorismate pyruvate lyase, arog structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phe), tkth gene encoding transketolase, ppsh gene encoding phosphoenolpyruvate (PEP) synthase, arog gene encoding chorismate synthase, arof gene encoding chorismate synthase and arob converting chorismate to a selected aromatic compound. The method is used for converting thorismate to a selected aromatic compound. The method is aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is ubiC gene which encodes chorismate pyruvate lyase that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          380
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   246

The selected genes of the common aromatic pathway of the invention includes ublC gene encoding chorismate pyruvate lyase, arof structural gene encoding Jecoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phe), tktA gene encoding transketcloase, ppsA gene encoding phosphoenolpyruvate (PEP) synthase, arof gene encoding sencipyruvoylshikimate-3-phosphate (EBPS) synthase and aroB chorismate synthase, arol gene encoding sencipyruvate (PHQ) synthase. If aroA gene encoding 3-dehydroquinate (PHQ) synthase. The method is used for converting chorismate to a selected aromatic compound. The method is particularly used for the production of commercially acceptable levels of aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is pME2 plasmid which comprises ubiC, aroG, tktA and ppsA genes involved in the aromatic pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    306
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              440

Transgenic plants containing a bacterial gene which encodes an enzyme able to catalyse prodn. of an antiviral bactericidal, fungicidal or insecticidal factor are new. A preferred gene is ubic from E.coli (AAQ92409) which codes for chorismate-pyruvate lyase (AAR74742). The lyase catalyses conversion of chorismate to p-hydroxybenzoic acid and transgenic tobacco plants which express the active enzyme are resistant to tobacco mosaic virus
                                                                                                                                           bacterial DNA coding for enzyme catalysing prodn. of resistance factor - contg. e.g. antiviral p-hydroxy-benzoic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                859
          The present sequence comprises the ubiquinone biosynthetic enzyme genes ubiC and ubiA, which were cloned from the chromosomal DNA of B. coli (Kohara map phage DNA bank IFB (634); Cell 50, 495-508 (1987)). A large mat. of ubiquinone-10 can be produced by culturing photosynthetic bacteriat transformed with the novel plasmid pRSPAC, which contains the ubiC and ubiA genes and the glutamate synthase gene promoter, specifically the Rhodobacter capsulatus transformant MC9R/pRSFAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                       560 ATCCCGGAAGAACTGCCGCTGCTGCCGAAAGAGTCTCGTTACTGGTTACGTGAAATTTTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the present sequence is that of the coding region of the Escherichia colistrain W3110 ubic gene in expression construct pET24a. The gene encodes chorismate pyruvate lyase (CPL, see AAM50968). It was obtained by PCR amplification of strain W310 genomic DNA using primers (see ABA91839-40) based on the published E. coli ubic gene. The CPL open reading frame is used in an expression cassette designed for the high-level production of p-hydroxybenzoic acid (pHBA) in green plants. The expression cassette comprises the CPL coding sequence operably linked to a promoter capable of dirving protein expression in higher plants. The expression as sequence encoding a chloroplast transit peptide, its natural cleavage site, and a small portion of a transit peptide donor protein fused to the N-terminus of CPL. The chloroplast targeting sequence targets the foreign protein to the chloroplast and aids in its uptake into the organelle. The cleavage site is unique to the transit peptide, and cleavage of the cleavage site is unique to the transit peptide and cleavage of the cleavage site is unique to the transit peptide donor protein movel polypeptide that has full enzyme activity, comprising the mature CPL enzyme and a small portion of transit peptide donor (see AAM50861). A polyper comprising the mature CPL enzyme and a small portion of transit peptide donor (see AAM50861).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing para-hydroxy benzoic acid in green plant, comprises expression of unique expression cassette containing gene encoding chorismate pyruvate lyase operably linked to specific chloroplast targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   soybean, rapeseed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, millet, bean, pea, rye, flax or a forage grass. pHBA is a monomeric component of ilquid crystal polymers which have application in the

The invention relates to a novel isolated nucleic acid that encodes a UDP -glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (p-hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LPB) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the Escherichia coli chorismate pyruvate lyase (CPL, UDiC) DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           247 CTGGATCCGCAACTGCTCGACTGGCTGTTGCTGGAGGATTCCATGACAAAACGTTTTGAA 306

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                               The present invention relates to the isolation of Arabidopsis thaliana gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose malate sinapoyltransferase (SMT). SMT catalyses the sinapoylglucose:malate sinapoyltransferase (SMT). SMT catalyses the aubstitution of a glucose moiety on a glycosylated aromatic acid with a malate moiety to form a malate conjugated aromatic acids. Carboxyllo acid susful for producing malate conjugated aromatic acids, carboxyllo acid aromatic acids or aromatic esters. The malate conjugated aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for chorismate pyruvate lyase (CPL) in pBT248 Bscherichia coli expression construct is described in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   306

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and anno acid sequences. Abs64197-Abs94564 represent novel human diagnostic coding sequences. Abs64197-Abs94564 represent novel human diagnostic coding sequences. Abs64197-Abs94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed specification.

```

The state of the s

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing aromatic acid conjugates, involves contacting glycosylated aromatic acid with malate, alpha-hydrocarboxylic acid or alcohol in the presence of sinapoylglucose:malate sinapoyltransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNG1; sinapoylglucose accumulator 1; SMT; aromatic ester; plant; sinapoylglucose:malate sinapoyltransferase; glycosylated aromatic acid; malate conjugated aromatic acid; polymer synthesis; ubic; TP-CPL; gene; carboxylic acid conjugated aromatic acid; chorismate pyruvate lyase; tomato Rubisco small subunit precursor; rbcS2; mutant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of Arabidopsis thaliana gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose:malate sinapoyltransferase (SNT). SNT catalyses the substitution of a glucose moiety on a glycosylated aromatic acid with a malate moiety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylic acid conjugated aromatic acids, carboxylic acid

PCR (see ABASOSS) are deed to generate a DNA fragment corresponding to the transit peptide of tomato Rubisco small candent was ligated into pET24a-CPL, which carries the Becherichia coli capunit and the first 4 amino acid residues of mature Rubisco. The DNA cragment was ligated into pET24a-CPL. Which carries the Becherichia coli cPL open reading frame (see ABASOSS). The TP-CPL construct is an example of expression cassettes of the invention that are designed for the high-col production of p-hydroxybenzoic acid (pHBA) in higher plants. Cleavage of TP-CPL in the chloroplast releases a novel polypeptide (see AMSOSS) that has full arzyme activity, converting chorismate to pHBA. A claimed plant comprising a CPL expression cassette is selected from soybean, rapessed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, millet, bean, pea, rye, flax or a forage grass. PHBA is a monomeric component of liquid crystal polymers which have application in the automative, electrical and other industries. (Updated on 29-AUG-2003 to

aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for TP-CPL (tomato Rubisco small subunit precursor for rbcS2-Escherichia coli chorismate pyruvate lyase (CPL)) fusion protein is described in the examples of the present invention

The invention relates to a novel isolated nucleic acid that encodes a UDP -glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (phydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LCPB) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   411
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzolc acid (p-hydroxybenzolc acid, pHBA) in a blosynthetic pathway to produce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hydroquinone glucoside; arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside; chorismate pyruvate lyase; CPL; 4-hydroxycinnamoyl-CoA hydratase/lyase; HCHL; gene expression; hydroquinone; antiseptic; transgenic plant; genetically engineered microorganism; antioxidant; antimicrobial agent;
arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is tomato rubisco small subunit precursor (rbcS2) transit peptide (chloroplast transit peptide; TP)-Escherichia coli CPL chimeric DNA. This sequence is present in the E. coli expression vector construct pBT24a-TP-CPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C. parapsilosis pHB 1-H- E. coli CPL- A. thaliana UGT72B1 chimeric DNA.

```

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxypenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyravet lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydrates/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA 1-hydroxylase (BHB 1-H)-Bscherichia coli chorismate pyruvate lyase (CPL) and Arabidopsis thaliana UDP-glucosyltransferase (UGT72B1) chimeric DNA

Sequence 3452 BP; 932 A; 730 C; 856 G; 934 T; 0 U; 0 Other;

able to catalyse prodn. of an antiviral, bactericidal, fungicidal or insecticidal factor are new. A preferred gene is ubiC from E.coli (AAQ22409) which codes for chorismate-pyruvate lyase (AAR74742). The lyase catalyses conversion of chorismate to p-hydroxybenzoic acid and transgenic tobacco plants which express the active enzyme are resistant to tobacco mosaic virus

The present sequence is that of the coding region of the Escherichia colistrain W3110 ubic gene in expression construct pET34a. The gene encodes contributed by PCRR amplification of strain W3110 genemic DY that gene encodes amplification of strain W3110 genemic DNA using primers (see ABA$1839-40) based on the published E. coli ubic gene. The CPL open reading frame is used in an expression cassette designed for the high-level production of p-hydroxybenzoic acid (pHBA) in green plants. The expression cassette comprises the CPL coding sequence operably linked to a promoter capable of driving protein expression in higher plants. The cassette also has a sequence encoding a chloroplast transit peptide, its natural cleavage site, and a small portion of a transit peptide donor protein fused to the N-terminus of CPL. The chloroplast targeting sequence targets the foreign protein to the chloroplast and aids in its uptake into the organalle. The cleavage site is unique to the transit peptide, and cleavage of the cleavage site is unique to the transit peptide, and cleavage of the chimeric protein encoded by the cassette at this site releases a novel collimaric protein encoded by the cassette at this site releases a novel collimaric protein encoded by the cassette at this site releases a novel collimaric protein encoded by the cassette at this site releases a novel collimary and a small portion of transit peptide donor (see AAM50951). A plant comprising the CPL expression cassette is claimed, and may be sobben, rapeseed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, anillet, bean, pae, rye, flax or a forage grass. PHBA is a monomeric component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the component of the configuration in dustries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CAGCAGGAAAAACGGTAAGCGTGACGATGATCCGCGAAGGGTTTGTCGAGCAGAATGAA 180

substitution of a glucose molety on a glycosylated aromatic acid with a malate molety of form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylic acid conjugated aromatic acids or aromatic acids or aromatic acids or aromatic passent acquence representing the ORF (open reading frame) for chorismate pyravate lyase (CPL) in pET248 Escherichia coli expression construct is described in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      46 GlnGlnGlyLysThrValSerValThrMetIleArgGluGlyPheValGluGlnAenGlu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LeuCysAlaAspGlyGluProTrpLeuAlaGlyArgThrValValProValSerThrLeu

                                                                                                                                                                   ò
                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated nucleic acid that encodes a UDP-glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (p-hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LCPs) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and commettic industries. The encoded enzymes may be used for in the food production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the Escherichia coli chorismate pyruvate lyase (CPL, UDiC) DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial
                                                                                                                                                                                                                                                                                              480

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  p-hydroxybenzoic acid; pHB; aromatic pathway; carbon source; ubiC; chorismate pyruvate lyase; ppsA; phosphoenolpyruvate synthase; pps psB synthase; tkA; transketolase; aroC; chorismate synthase; aroA; 5-enolpyruvoylshikimate-3-phosphate synthase; BPS synthase; aroL; shikimate kinase II; aroB; 3-dehydroquinate synthase; DHQ synthase; aroG; 3-deoxy-D-arabino-heptulosonate-7-phosphate synthase; DHAP synthase; ds.
protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxyciunamoyl-CoA hydratase/lyase (HFLL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Escherichia coli chorismate pyruvate lyase (CPL) DNA. This sequence is found in the E. coli expression vector construct pET244(+).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ArgArgSerArgLeuArgLeuSerGlyLysProLeuLeuThrGluLeuPheLeuPro 165

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids acid (pHB) which comprises transforming microorganisms with plasmids carying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubiC gene encoding chorismate pyruvate lyses, arog tructural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phb), tktA gene encoding transketolase, ppsA gene encoding phosphoenolpyruvate (pEPB) synthase, arog gene encoding chorismate synthase, arol gene encoding shikimate kinase II, aroA gene encoding 5-enolpyruvylahikimate-3-phosphate (BESP) synthase and aroB gene encoding 3-dehydroquinate (DHQ) synthase. The method is used for converting chorismate to a selected aromatic compound. The method is aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is ubiC gene which encodes chorismate pyruvate lyase that
                                                                                                                                                                                                                                                                                                                          Producing aromatic compounds, especially commercially acceptable levels of p-hydroxybenzoic acid, comprises developing genetically engineered bacteria that carry selected genes of the common aromatic pathway.
                                                                                                                                                                                                                                                 Amaratunga M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids carrying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubic gene encoding chorismate pyruvate lyase, arog structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phb), tkth gene encoding transketolase, ppsA gene encoding phosphoenolpyruvate (PEP) synthase, arog gene encoding chorismate synthase arol gene encoding shikimate kinase II, aroA gene encoding converting 5-enolypruvoylBhikimate-3-phosphate (BESP) synthase and aroB gene encoding 3-dehydroquinate (DHQ) synthase. The method is used for converting chorismate to a selected aromatic compound. The method is aromatic compounds, particularly used for the production of commercially acceptable levels of aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is pME2 plasmid which comprises ubiC, arog, tktA and ppsA genes involved in the aromatic pathway

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence comprises the ubiquinone biosynthetic enzyme genes ubic and ubiA, which were cloned from the chromosomal DNA of E. coli (Kohara map phage DNA bark IP8 (634); Cell 50, 495-508 (1987)). A large amt. of ubiquinone-10 can be produced by culturing photosynthetic bacteria transformed with the novel plasmid pRSFAC, which contains the ubic and ubiA genes and the glutamate synthase gene promoter,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genes coding for ubiquinone biosynthetic enzymes - useful for prodn. of ubiquinone-10 by transformed photosynthetic bacteria.
                                                                                                            PheThrSerSerThrLeuThrArgAspPheIleGluIleGlyArgAspAlaGlyLeuTrp

The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (PCH) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA 1-hydroxylase (PHB 1-H) and Escherichia coli chorismate pyruvate lyase (CPL) chimeric DNA.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of a sexpressed sequence tags for identifying expressed cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of stress expressing (II). (II) and (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AASA197-AAS94564 represent novel human diagnostic coding sequences of the involving aberrant the printed specification, but was obtained in printed for the contract of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  105
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        125

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 80
                                                                                                         Transgenic plants containing a bacterial gene which encodes an enzyme able to catalyse prodn. of an antiviral, bactericidal, fungicidal or insecticidal factor are new. A preferred gene is ubic from E.coli (AAQ92409) which codes for chorismate-pyruvate lyase (AAX74742). The lyase catalyses conversion of chorismate to p-hydroxybenzoic acid and transgenic tobacco plants which express the active enzyme are resistant
                                         Transgenic plants with increased content of resistance factor - contg. bacterial DNA coding for enzyme catalysing prodn. of resistance factor, e.g. antiviral p-hydroxy-benzoic acid.

The present sequence is that of the coding region of the Escherichia colistrain W3110 ubic gene in expression construct pET24a. The gene encodes chorismate pyravate lyses (CPL, see AAMS0968). It was obtained by FCR amplification of strain W310 genomic DNA using primers (see ABA91839-40) based on the published E coli ubic gene. The CPL open reading frame is used in an expression cassette designed for the high-level production of cp-hydroxybenzoic acid (pHBA) in green plants. The expression cassette comprises the CPL coding sequence operably linked to a promoter capable of driving protein expression in higher plants. The cassette also has a sequence encoding a chloroplast transit peptide, its natural cleavage stee, and a small portion of a transit peptide donor protein fused to the N-terminus of CPL. The chloroplast tarnsit peptide, its natural cleavage crite, and a small portion of a transit peptide, and cleavage of the chloroplast and aids in its uptake into the organalle. The chloroplast and aids in its uptake into the organalle. The chloroplast and aids in its uptake into the organalle. The chloroplast and assetted and cleavage of the chloroplast encoded by the cassette at this site release a novel collary each a small portion of transit peptide donor (see AAMS0961). A plant comprising the CPL expression cassette is claimed, and may be component, pageseed, sunflower, cotton, corn, tobacco, alfalfa, wheat, and expression and compared and and may be component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the component of liquid crystal polymers which have application in the component of liquid crystal polymer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing para-hydroxy benzoic acid in green plant, comprises expression of unique expression cassette containing gene encoding chorismate pyruvate lyase operably linked to specific chloroplast targeting

The present invention relates to the isolation of Arabidopsis thaliana gene (SNG1, sinapoylglucose accumulator 1) encoding sinapoylglucose.malate sinapoyltranaferase (SMT). SWT catalyses the substitution of a glucose moiety on a glycosylated aromatic acid with a malate moiety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylic acid conjugated aromatic acids or aromatic esters. The malate conjugated aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for chorismate pyruvate lyase (CPL) in pBT24a Escherichia coli expression construct is
                                  Producing aromatic acid conjugates, involves contacting glycosylated aromatic acid with malate, alpha-hydrocarboxylic acid or alcohol in t presence of sinapoylglucose:malate sinapoyltransferase.
                                                                                                                                                                                                                                     BP; 112 A; 122 C; 141 G; 120 T; 0 U; 0 Other;
                                                                                                                                                                                                               described in the examples of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated nucleic acid that encodes a UDP -glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (phydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the Escherichia colismate pyruvate lyase (CPL, UDiC) DNA of the invention.

   hydroguinone glucoside (arbutin, 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid, pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Bscherichia coli chorismate pyruvate lyase (CPL) DNA.

The present nucleotide sequence is that of an open reading frame encoding chloroplast-targeted chorismate pyruvate lyase (CPL) fusion protein TP-CC chloroplast-targeted chorismate pyruvate lyase (CPL) fusion protein TP-CC CPL (see ABM50959). PCR (see ABM5091841-42) was used to generate a DNA fragment corresponding to the transit peptide of tomato Rubisco small subunit and the first 4 amino acid residues of mature Rubisco. The DNA CC fragment was ligated into pET24a-CPL. Which carries the Escherichia coli CCPL open reading frame (see ABA91837). The TP-CPL construct is an example CC expression cassettes of the invention that are designed for the high-CC leavage of TP-CPL in the chloroplast releases a novel polypeptide (see AM50961) that has full enzyme activity, converting chorismate to pHBA. A claimed plant comprising a CPL expression cassette is selected from soybean, rapeseed, sunflower, cotton, corn, tobacco, alfalfa, wheat, C batley, oats, sorghum, rice, Arabidopsis, sugarbeet, sugarcane, canola, millet, bean, pea, rye, flax or a forage grass. PHBA is a monomeric C component of liquid crystal polymers which have application in the automotive, electrical and other industries. (Updated on 29-AUG-2003 to
